BlindSpot · demo script

Website walkthrough · about 3:00 at a steady pace · **bold** = pause and let it land · *italics* = what to click

1 · HOME PAGE `0:00–0:14`

Hold on the top of the page; let the live panel animate.

"A business doesn't fall in a day. It fades in numbers nobody had time to read. **The data always knew. Nobody thought to ask it.**

BlindSpot is an AI analyst for small online stores. It reads your sales, finds what's quietly costing you money, and proves every problem it finds."

2 · THE PROBLEM `0:14–0:30`

Scroll to "Small shops run on gut feeling".

"Dashboards show *what* happened, never *why*. A total can keep rising while a loyal customer leaves or a best-seller fades. **Every chart said growing. None said going.** Big companies pay analysts to catch that every week. Small shops have a spreadsheet and a hunch."

3 · HOW IT WORKS `0:30–1:00`

Open How it works. Point at Connect → Clean → Check → Scan → Prove → Act, then scroll to the four rules.

"Here's what happens to your data. First it **cleans**: exact duplicate lines are counted once, returns and fees are separated from sales, and if an order line was bought and then canceled within two days, with the same customer, product, quantity and price, both sides are removed, because that money was never real.

Then it **checks** what matters to a shop: best customers who went quiet, new customers who never return, returns, products that stopped selling, seasonality.

Then it **scans**. For every major product and country, it measures that item's share of each week's revenue and compares it with the same weeks a year earlier, so a holiday rush can't fake growth.

Last, it **proves** it. A drop only counts if it passes a Welch t-test, corrected for testing many items at once. Weak signals are marked 'not confirmed' instead of being sold to you as fact."

4 · REAL RESULTS `1:00–1:10`

"I tested it on over a million rows of real retail sales, then rewrote the key calculations in a completely separate Python script. **Every headline number matches.**"

5 · OPEN THE APP → UPLOAD `1:10–1:25`

Open the app → click "Try a 68-page PDF sales report" → Next.

"You can connect Shopify read-only, or upload a CSV, Excel or PDF export from almost any platform. Excel is read right in your browser. A PDF has no table inside it, just words at positions, so BlindSpot rebuilds the rows from the spacing between lines and finds the columns from the headings. Then it works out what each column is, from its name in any of eight languages and from what's inside it: dates, money, emails, IDs."

6 · "HERE'S HOW WE READ YOUR FILE" `1:25–1:37`

Point at the column cards, then the "From file to analysis" line.

"Before it shows you a single result, it shows you how it read your file: which column it took as the date, the amount, the customer; every row it fixed or left out; and how many records went into the analysis. If it read something wrong, you change it in one click. **Nothing hidden. Nothing guessed.**"

Click "Looks right".

7 · OVERVIEW `1:37–1:50`

"The health score starts at a hundred, and every problem takes points off, more for serious, well-proven ones. Findings are ranked by the money involved, and each is labeled **measured**, **tested** or **rule of thumb**, so you always know how sure to be. 'Fix this first' is the single biggest problem."

8 · SOURCE DATA `1:50–1:57`

"Source Data lists every row that was analyzed, with the same definitions as the dashboard, so the totals can be checked by anyone."

9 · RISK INTELLIGENCE

1:57–2:12

Open the top finding → "See the affected rows" → point at the green badges.

"Each finding stores exactly how it was calculated: which customers or products, which dates, which kind of row. **See the affected rows** replays that calculation on the raw data, adds it up in pennies, and compares it with the finding. **They match to the penny.**"

10 · AI ANALYST

2:12–2:32

Click "Why did revenue change?"

"Here's how the AI fits in. Claude never calculates anything itself. It's given fifteen read-only tools, typed functions that run the real math. It decides which ones to call, the server runs them, and Claude turns the results into plain English, showing every tool it used. When it suggests a new idea about your business, that idea is turned into a statistical test and checked before you see it. **AI suggests. Math checks.**"

11 · SIMULATOR AND DASHBOARD AUDIT

2:32–2:46

Drag "Keep more customers", then open Dashboard Audit.

"The Simulator is plain formulas you can see: keep a few more customers, and it multiplies your revenue by the churn you avoid and your margin. Every assumption is editable. Dashboard Audit checks chart settings for misleading axes, and tests every color for contrast and for how it looks to color-blind viewers."

12 · EXECUTIVE REPORTS

2:46–3:00

Scroll to Priority recommendations, Every topic checked and the roadmap.

"The report checks ten areas of the business and records which checks actually ran and why any couldn't. Each problem becomes an action with an honest planning assumption, like 'assumes twenty percent recovered', and the actions are ordered into a 30, 90 and 180-day roadmap by effort."

13 · CLOSE

3:00–3:10

"Under the hood: React and TypeScript, a Node server, my own statistics engine, thirty-four typed tools also available over MCP, and Claude. **Every sale tells a story. BlindSpot reads them all.**"

Time check

This runs about 3:10. Remote Control AI and Arbiter allow 3 minutes max. To get under 3:00, cut in this order:

- Section 8 (Source Data). Section 9 shows the rows anyway.
- The second sentence of section 11 (Dashboard Audit).
- Section 4 (Real results): move "Every headline number matches" into section 3.

Before recording

- Open the site 2 minutes early and click through once.
- Zoom the browser to 90%, close other tabs, full screen.
- In Canva: camera off, microphone on, share only the BlindSpot window.
